1. EFSA; Tender for updating upper limits for seven micronutrients

The NNR2022 project leader has been contacted by EFSA with an invitation to submit a tender for updating Tolerable Upper Intake Levels (ULs) for selected vitamins and minerals (vitamin A, vitamin D, vitamin B6, folic acid, iron, manganese, and beta-carotene). Members of the NNR project have established a project team and have submitted a joint tender for all seven micronutrients. This project, if funded, will be independent from the NNR project. However, the two projects will benefit greatly from each other and may foster appropriate harmonization in methodology and principles for setting ULs by EFSA and the eight countries utilizing the NNR2022 final report. Evaluation results will be available during September.

2. Methodology for setting/updating dietary reference values (DRVs)

The NNR2022 Committee discussed the methodology for setting and updating DRVs. The NR2022 project aims to develop an analytical framework for setting DRVs for all the nutrient chapters.

3. Handling of chapters

The first drafts for some of the nutrient and food group chapters are ready, and the NNR2022 Committee have established a process and a procedure to organize the peer-review period, public hearings, editing etc. The NNR2022 Committee discussed some main principles and structure of the chapters. Public hearings will be announced at our official web-page.

4. Status work on sustainability

This point is postponed until the next meeting due to limited time.
